

WHAT IS CLAIMED IS

1 1. A method for estimating a NOx occlusion amount
2 of a NOx occlusion catalyst interposed in an exhaust
3 passage in an engine, characterized in comprising
4 the steps of:

5 estimating said NOx occlusion amount using a
6 polynomial reflected with a NOx occlusion
7 characteristics of said NOx occlusion catalyst, and
8 correcting each coefficient of said polynomial
9 sequentially on the basis of NOx purification rates
10 actually measured.

1 2. A method for estimating a NOx occlusion amount
2 according to claim 1, characterized in that

3 the polynomial for obtaining the NOx occlusion
4 amount x which is used in said estimating step
5 includes a NOx purification rate r , an exhaust gas
6 temperature y and an exhaust gas flow velocity z ,
7 and

8 said polynomial is a polynomial obtained by
9 multiplying said exhaust gas temperature y and said
10 exhaust gas flow velocity z by respective
11 coefficients.

1 3. A method for estimating a NOx occlusion amount

2 according to claim 2, characterized in that said
3 polynomial is expressed by the following equation;
4
$$x = [r - (k_0 + k_2y + k_3z \dots)] / (k_1 + k_4y + \dots)$$

5 here, k_i ($i = 1, 2, \dots$) are coefficients.

1 4. A method for estimating a NOx occlusion amount
2 according to claim 2, characterized in that said
3 correcting step comprises, in an occasion of
4 correcting said coefficient sequentially:
5 estimating the (N+1)-th NOx purification rate
6 r on the basis of the N-th (N is a natural number)
7 NOx occlusion amount x obtained from said polynomial,
8 and
9 correcting each coefficient such that said
10 estimated (N + 1)-th NOx purification rate r becomes
11 the NOx purification rate r actually measured.

1 5. A method for estimating a NOx occlusion amount
2 according to claim 4, characterized in that the
3 coefficient is corrected by using the method of least
4 square.

1 6. A method for estimating a NOx occlusion amount
2 according to claim 1, characterized in that a NOx
3 discharging amount in said NOx occlusion catalyst

4 is calculated according to the following equation.

5 $\text{NOx discharging amount} = \int (\text{reducing agent}$
6 $\text{concentration at catalyst inlet} \times \text{reducing agent}$
7 $\text{utilization rate} - 0.5 \times \text{oxygen concentration in}$
8 $\text{catalyst inlet}) \times \text{exhaust gas flow rate}$

1 7. A method for estimating a NOx occlusion amount
2 according to claim 6, characterized in that:

3 said reducing agent utilization rate is set
4 on the basis of exhaust gas temperature y and exhaust
5 gas flow velocity z, and at the same time

6 the characteristics of the reducing agent
7 utilization rate are stored in a reducing agent
8 utilization rate setting map.

1 8. A method for estimating a NOx occlusion amount
2 according to claim 6, characterized in that:

3 said reducing agent utilization rate is
4 estimated using a polynomial which is reflected with
5 a NOx discharging characteristics of the NOx
6 occlusion catalyst, and

7 the coefficients of said polynomial are
8 sequentially corrected on the basis of the
9 concentration of reducing agent.

1 9. A method for estimating a NOx occlusion amount
2 according to claim 8, characterized in that:

3 the polynomial for obtaining the reducing
4 agent utilization rate r' includes a catalyst inlet
5 reducing agent concentration x' , an exhaust gas
6 temperature y and an exhaust gas flow velocity z ,
7 and

8 said polynomial is a polynomial obtained by
9 multiplying said catalyst inlet reducing agent
10 concentration x' , said exhaust gas temperature y
11 and said exhaust gas flow velocity z by respective
12 coefficients.

1 10. A method for estimating a NOx occlusion amount
2 according to claim 9, characterized in that the
3 polynomial for obtaining the reducing agent
4 utilization rate r' is expressed by the following
5 equation;

$$\begin{aligned} 6 \quad r' &= f(x', y, z) \\ 7 \quad &= m_0 + m_1x' + m_2y + m_3z + m_4x'y + m_5yz + m_6zx' \\ 8 \quad &\quad + m_7x'^2y + m_8x'y^2 + \dots \end{aligned}$$

9 here, m_i ($i = 1, 2, \dots$) are coefficients.

1 11. A method for estimating a NOx occlusion amount
2 according to claim 1, is characterized in that:

3 said engine is constituted such that switching
4 can be performed between a lean operation where an
5 exhaust gas air-fuel ratio is lean and a rich
6 operation where said exhaust gas air-fuel ratio is
7 rich, and

8 said coefficients of the polynomial are held
9 during said rich operation, and when a difference
10 between the NOx purification rate obtained by using
11 said held coefficients at a starting time of the
12 lean operation and said NOx purification rate
13 actually measured is equal to or more than a threshold
14 value, said NOx occlusion amount is corrected.

1 12. A method for estimating a NOx occlusion amount
2 according to claim 11, characterized in that the
3 NOx occlusion amount is corrected, when a difference
4 between an actually measured value of the NOx
5 purification rate r at the starting time of the lean
6 operation of said engine and an estimated value
7 thereof is equal to or more than a threshold value.

1 13. A method for estimating a NOx occlusion amount
2 according to claim 12, characterized in that said
3 NOx occlusion amount is corrected based upon a
4 judgment that a NOx occlusion amount calculated at

5 the starting time of the lean operation is incorrect,
6 when a difference between said NOx purification rate
7 estimated by the polynomial and the NOx purification
8 rate obtained by actual measurement immediately
9 after switching is performed from the rich operation
10 of said engine to the lean operation thereof is equal
11 to or more than a predetermined value.

1 14. A method for estimating a NOx occlusion amount
2 according to claim 1, characterized in judging that
3 said catalyst is abnormal, when an average value
4 of said each coefficient in a predetermined period
5 is deviated from a predetermined range.
